

HOW TO USE IT · VIA CLAUDE CODE

Slash commands

The power surface: the same jobs as the dashboard, driven by typed commands — best for bulk runs, scripting, and automation.

SETUP

Two env vars, then type "/"

- 1 Open the repo in **Claude Code** (web or desktop). The skills auto-load — nothing to install.
- 2 Set your token: `AIOS_SKILL_TOKEN` (and `AIOS_BASE_URL` for prod).
- 3 Type `/` to see the commands. Multi-word arguments go in quotes.

The commands you'll use most

- `/content` — the content hub (create service/blog/local pages).
- `/citation-submit "Client" US` — build citations across the catalog.
- `/citation-builder "Client"` — audit what's listed vs missing.
- `/audit "site.com"` — a scored SEO health report.
- `/monthly-report "Client"` — a shareable client report.

Why the output is trustworthy

- 1 **Nothing goes live on its own.** Content is drafted for review; the risky last step is always a human's.
- 2 **It never invents facts.** If it needs the client's real phone, address, or a proof point, it asks — you give the real answer.
- 3 **LEAD-gated actions.** Some jobs need an owner/admin/manager to approve — by design.

Dashboard vs Claude Code — same engine

Both drive the same backend. Use the **dashboard** for daily point-and-click work, **Claude Code** for bulk runs + the local citation finisher, and the **double-click batch file** when you just want to click Publish on the prepared listings.
