

WHAT IT IS · WHAT WE BUILT · HOW TO USE IT

Your SEO platform

One system that audits sites, writes ranking-grade content, builds citations, and publishes web-2.0 backlinks — run it from the browser, from your desktop, or from Claude Code.

WHAT IT IS

One platform, five jobs

AIOS automates the repetitive SEO work an agency does by hand — and keeps a human in control at every publish gate.

Content

- Research a page set (or skip it and add one page).
- Match the client's design + pick a template.
- AI writes it behind a 14-point QA gate; you review + publish to WordPress.

Citations

- Audit what's listed vs missing.
- Bot creates the directory account + fills the listing + solves the captcha.
- Auto-publishes where it can; hands you a one-click finish where it can't.

Web 2.0

- Publishes real articles carrying a backlink to high-authority platforms.
- API-based, so no per-post friction on the connected platforms.

Audit • Radar • Reports

- Scored site audits, policy-change radar, client reports.
- All behind the same money-dial + spend controls.

Three ways to run it — pick per person

1

Dashboard (browser) — daily team use

2

Locally (double-click) — the citation finisher

3

Claude Code — slash commands, bulk + power

This engagement

63+

citation directories wired with real signup flows

26

accounts built + ready to finish (US/UK/CA/AU)

20

web-2.0 articles published live with backlinks

1

live citation proven end-to-end (Brownbook)

15

captchas auto-solved during the run

catch-all mailbox + captcha solver wired in prod

Pros

- Everything up to the final "Publish" is automated — signup, captcha, email-verify, form-fill.
- Human control at every publish gate — nothing goes live on its own.
- Runs from a browser, a desktop double-click, or Claude Code.
- Honest reporting — never invents a business NAP or a fake metric.
- Data-driven catalog — new platforms slot in without re-engineering.

Cons / honest limits

- A minority of directories re-check a captcha at the last step — that click is manual (the handoff).
- Some web-2.0 platforms block automated signup (OAuth apps / Google / invites) — those need a one-time manual account.
- The interactive "finish" browser runs locally, not in the hosted dashboard (a hosted tab can't hold a live session).
- A wrong client NAP hurts — so real, exact business details are required up front.

The bottom line: **we did the heavy lifting** — the accounts, the flows, the live proof — and gave you three simple ways to run it. The three guides in this pack show each, step by step.
