

Access & Accounts

Two things we need from you — and the 238 platform accounts the extension publishes through.

2

things still needed

238

platform accounts to create

0

client modules to connect

Replaces revision 1. Everything the old version asked for that this platform does not actually have has been removed — page 5 lists what and why.

At a glance

The list is short. Two credentials, then accounts on the platforms we publish to. Nothing else is asked of you.

1

DataForSEO

The SEO data source. Never supplied — we are funding it ourselves today.

2

A working email account

The one sent recently does not authenticate. Every account signup needs it.

3

238 platform accounts

163 citation directories + 75 Web 2.0 platforms. Created once, used by the extension forever after.

4

Each client's business record

Name, address, phone, hours, categories, description, logo. Entered once per client — every submission is filled from it, so the details never drift.

Everything else — already in place

7 platform keys are installed and running on our side.

What changed in this revision

Revision 1 asked for 10 things this platform does not have or does not need — Google Business Profile, website / CMS, Analytics and Search Console modules among them. All 10 are removed. What replaced them is the one ask that was missing: the SEO data API.

The rule that runs the whole system

- The extension is the publisher. Every citation and every Web 2.0 post goes out through it.
- Direct APIs are a fallback, never the path — they do not get near a 100% success rate.
- An operator presses submit. Always a person, in their own browser.

What we still need

Two items. One key, one mailbox. Both are agency-level — one of each covers every client.

DataForSEO

NEEDED

RANKINGS & KEYWORD DATA

WHAT IT POWERS

Map-pack grid probes (every numbered rank pin), keyword volumes, backlink and referring-domain data

WITHOUT IT

Grid rank tracking, keyword volumes and the backlink profile all stop the moment our own credit runs out

WHY WE ARE ASKING

This is the one SEO data source that has never been supplied. We are paying for it out of our own account today, so every grid probe, keyword figure and backlink number in the platform is billed to us.

WHERE / COST

dataforseo.com - one account, covers every client · Paid, per API call

DATAFORSEO_LOGIN + DATAFORSEO_PASSWORD

A working email account

NEEDED

ACCOUNT SIGNUP & VERIFICATION

WHAT IT POWERS

Creating and verifying every citation-directory and Web 2.0 account, then reading back the confirmation link each platform emails

WITHOUT IT

No new directory or Web 2.0 account can be created or confirmed - the whole extension lane stalls at signup

WHY WE ARE ASKING

An email account was sent recently but it does not work - it will not authenticate, so no confirmation mail can be read and no new account can be activated. We need a working one: ideally a catch-all domain mailbox, or a Gmail with IMAP enabled and an app password.

WHERE / COST

Any mailbox you control, with IMAP switched on · Free

IMAP host, user and password (plus SMTP to send)

Already installed

7 keys, all live on our side, all covering every client from a single account.

Anthropic / AgentRouter

IN PLACE

All content research and writing, and the AI form-fill that maps a value to the right field on a page it has never seen

ANTHROPIC_API_KEY + ANTHROPIC_BASE_URL (AgentRouter proxy)

Serper.dev

IN PLACE

Live Google SERP reads - rankings and the coordinates behind grid tracking

SERPER_API_KEY

Google APIs

IN PLACE

The Google OAuth client that Google platform logins run through, Blogger included

GOOGLE_OAUTH_CLIENT_ID + GOOGLE_OAUTH_CLIENT_SECRET

Image Generation

IN PLACE

Images generated inside articles and Web 2.0 posts

IMAGE_GEN_API_KEY

Google Sheets

IN PLACE

Service account behind the Sheets-backed stores

GOOGLE_SHEETS_SA_JSON

Resend

IN PLACE

Transactional email - reports and client notifications

RESEND_API_KEY

Foursquare

IN PLACE

Independent check that a citation actually went live

FOURSQUARE_API_KEY

A note on the AI layer

All model calls run through AgentRouter rather than straight to Anthropic — same Claude models, one router in front, so a provider or quota problem is a routing change instead of a redeploy. The key and the base URL are both set.

Not part of this platform

Revision 1 asked for all of these. None of them exist here, or none of them are needed. They are listed rather than quietly dropped, so the change is visible.

Google Business Profile access	×	There is no GBP module in this platform. GBP is one citation target in the directory list, not a connected module.
Website / CMS login	×	There is no website-CMS module. We do not make on-page changes to the client's own site from here.
Google Analytics	×	No analytics module. No traffic data is read, stored or reported.
Search Console	×	No Search Console module. Impressions and indexing state are not part of this platform.
Voyage Embeddings	×	Not needed. Content is written without a semantic memory layer.
Pinecone	×	Not needed - it only ever existed to hold those embeddings.
Slack webhook	×	Not needed. Failures surface in the dashboard.
Bing Places API	×	Not needed. Bing is covered as an ordinary directory in the citation list.
BrightLocal	×	Not needed. Citation status is verified by fetching the live listing URL, not by a third-party subscription.
Backblaze B2	×	Not needed from you - backups are ours to run.

Why this matters more than it looks

Asking a client for Google Business Profile, Analytics and Search Console access implies four modules that read and report on them. This platform has none of the four. Removing the ask keeps the document honest about what actually runs.

Everything goes through the extension

One lane for citations, one for Web 2.0 — the same mechanism underneath. The operator is logged in; the extension does the typing.

Why the extension, not the API

Direct publishing APIs exist for 42 of the 76 Web 2.0 platforms we use — about 55%. They are useful. They are not reliable enough to be the path.

The extension — the main lane

- Works on every platform, API or not
- The operator is already logged in — no token to expire
- Survives a redesign: fields are re-read, not hard-coded
- A person reviews before anything is published
- Same mechanism for citations and Web 2.0

Direct APIs — the fallback

- Only 42 of 76 platforms offer one
- Tokens expire, get revoked, or need app review
- Rate limits and silent rejections are common
- Nowhere near a 100% success rate on its own
- Used when it works; the extension picks up when it does not

Extension can publish		76 / 76
Direct API available		42 / 76
Extension covers citations		197 / 197
Citation submission APIs		2 / 197

Citations, specifically

There is effectively no submission API for directories — two of the 197 we submit to offer one. 45 of them put a CAPTCHA in the way, and solving it with a bot breaks their terms. So the extension is not a compromise here; it is the only route that leaves a listing safe from removal.

Web 2.0 — where to create accounts

76 platforms are in use. 75 need an account made once, by hand, in a browser. After that the extension publishes into them.

76 platforms in use	75 need an account	42 also have an API fallback	14 deliberately excluded

tupalo.com	GLOBAL US CA	3→1
tuugo.us	GLOBAL US	3→1

By market

US	86
GLOBAL	35
CA	31
AU	29
UK	23

A client only needs the markets they trade in — a UK business works the 23 UK plus the 35 global entries, not all 204.

Create accounts in priority order

The 35 core directories on the next page carry most of the weight — they are the ones the aggregators and Google actually read. Work down from there; the tier-2 list behind them is volume, not leverage.

A CAPTCHA is not a blocker in this model. The operator is already on the page and solves it the way any person would — which is exactly why no listing here is ever at risk of being pulled for how it was created.

Citations — core 35

Do these first. 29 need an account; the 6 marked no account are fed from a data partner and need nothing from you at all.

One mailbox, 238 accounts

This is why the email account matters more than it sounds, and why the one we were sent has to be replaced before anything else starts.

Inbox · accounts@clientdomain.com			4 unread
Hotfrog	Confirm your business listing	acme-hotfrog@clientdomain.com	CITATION
Tumblr	Verify your email address	acme-tumblr@clientdomain.com	WEB 2.0
Brownbook	Activate your account	acme-brownbook@clientdomain.com	CITATION
Substack	Finish setting up your publication	acme-substack@clientdomain.com	WEB 2.0

Why aliases, not one shared address

Platforms ban the "one email, many accounts" pattern outright — and one shared login means a single suspension takes every client offline at once, while handing the platform your whole client list. Aliases keep each account independent.

What a working mailbox needs

- IMAP enabled, with the host and port
- An app password if it is Gmail — not the account password
- Catch-all routing if it is your own domain
- Enough room that confirmation mail is not bounced

What to send back

Four items. Each switches on its own capability the moment it lands — nothing has to arrive together.

DataForSEO login and password

One account, every client. Switches grid tracking, keyword volumes and backlink data onto your own billing instead of ours.

A working email account

IMAP host, username and password. Replaces the one sent recently, which does not authenticate. Nothing can be signed up for until this lands.

Platform accounts, as you want them used

163 citation directories and 75 Web 2.0 platforms — the full lists are in the accompanying spreadsheet, with sign-up links.

Each client's business record

Name, address, phone, hours, categories, description, logo and photos. Entered once; every submission is filled from it, so the details never drift.

How to send credentials

Never by email or chat. Use a one-time secret link, or type them straight into the dashboard — anything entered there is encrypted on arrival and is never shown again, not to us and not in any log.
