

AIOS · PLATFORM OVERVIEW

AIOS

Your SEO delivery, running itself.

A cloud platform that audits sites, writes and publishes content, gives every client their own portal, and quietly keeps watch on Google — so most of the work runs on its own, with a person approving the last step.

Audit

20–30+ page SEO reports, on demand

Content

Drafted, schema'd & published

Portal

A live dashboard per client

Policy Radar

Always watching Google

06 · Onboarding Checklist

what we need

THE FOUR MODULES

01 · Audit

20–30+ page SEO audits — on-page, technical, local and AI. Clients run them from the portal; a report comes back as a web page and a PDF.

02 · Content

AI drafts the copy, builds the schema, makes the images, then publishes to WordPress or exports a PDF. ~90% automated.

03 · Portal

Role-scoped dashboards: client, team, and admin. Reports, milestones, and upsell buttons that point to your Fiverr gigs.

04 · Policy Radar

Always-on. Researches Google's changes, flags them, and surfaces recommended actions in the Command Center.

02 THE IDEA

What AIOS is

AIOS turns SEO delivery into a self-running, cloud-hosted platform. One place to audit a site, generate and publish content, and give every client a live portal — all on cost-controlled infrastructure, with a human review checkpoint before anything reaches a client. It's cloud-based for one reason: to keep the cost of running automated work **predictable**.

THE PROBLEM

Manual audits and content take hours per page — and every automated run can burn API budget that's hard to predict.

The system

One cloud platform: click to audit, generate and publish content, and hand every client a branded self-serve portal on infrastructure that caps its own spend.

The payoff

Minutes per page instead of hours, a client base you can scale, and upsells that funnel straight to your Fiverr gigs.

A FEW THINGS THAT ARE TRUE IN EVERY PART OF THE PLATFORM

- **A person always approves.** Every report, email and published change is checked by a human before it reaches a client.
- **Cost is a dial, not a bill.** Each client — and each feature — can run free, low-cost, or fully automated. You turn it up only when their budget allows.
- **Your keys stay locked away.** Every API key and password lives in an encrypted vault, never in plain text and never in logs.
- **You own all of it.** The server, the accounts and every login are in your name from day one — no lock-in.

How it works

You don't need the plumbing to use it — but here's the shape. A modern web app talks to one service layer, which hands slow, costly jobs to a queue. Background workers do the heavy lifting against outside services through a shared, encrypted key vault. Everything runs on a single server you own.

Audit & Content

The two engines that do the visible work. Audit measures and diagnoses; Content creates and publishes. Both run on the same cost-controlled queue, so spend stays inside caps.

MODULE 01 · AUDIT

V1

Technical
Domain and technical issues — crawl, indexing, speed, schema, security.

V1

Actionable
Specific pages and fixes — title tags, NAP, headings, meta, on-page.

PHASE 2

Financial
Market capacity & potential-revenue estimate. Spec'ed now, built later.

WHAT HAPPENS AFTER A RUN

The report appears in the portal, the client's milestone advances, the Google Sheet updates, and the client is notified — **no manual steps**. The tier decides which paid data sources are allowed to run, keeping spend controlled.

MODULE 02 · CONTENT

05 MODULES 03 & 04

Portal & Policy Radar

The Portal is the face clients and your team use. Policy Radar is the always-on brain that keeps every client current with Google.

MODULE 03 · PORTAL — ONE APP, ROLE-SCOPED VIEWS

MODULE 04 · POLICY RADAR — THE LOOP

06 DELIVERY

How it gets built

An estimated 3–5 week build, in tracks that each end on something you can see and test — so progress is provable, not assumed. The full week-by-week plan and everything you receive are in the Roadmap and Scope documents.

0

Pre-reqs

Accounts & keys created in your name, server provisioned, test site connected. (See the Onboarding Checklist.)

1

Foundations

Core platform stood up; the audit engine runs as a job and returns a PDF.

2

Audit in the portal

A client logs in, runs an audit, and downloads the report.

3

Content module

Generate a page, review it, publish to WordPress.

4

Portal & Policy Radar

Milestones, upsells, reporting, admin oversight, and the Command Center go live.

5

Hardening & handover

Security pass, backups, testing with you, then production — in your name.

THE ONE LINE TO REMEMBER

Most of the work runs itself — a person still approves everything before it reaches a client.
