

WHO DOES WHAT

AIOS

Responsibility Matrix.

A simple, clear line between what we fix when a problem comes from our side, and what is out of our hands once the platform is up and running.

THIS DOCUMENT
Who fixes what,
and when

01 OVERVIEW

How to Read This Matrix

This document splits every kind of problem into two simple groups. The rule is easy: **we look after what we build**. If something goes wrong because of the software we made, we fix it. If it comes from another company's service, from something you give us, or from normal running costs, it's outside what we look after, though we'll always help you find out what's wrong.

2

SIMPLE GROUPS, NOTHING
IN BETWEEN

1

RULE: WE LOOK AFTER
WHAT WE BUILD

8

OUTSIDE SERVICES WE
RELY ON BUT DON'T RUN

\$0

WHAT YOU PAY WHEN THE
FAULT IS OURS

Group A — What We Look After

Anything that breaks because of the software, settings, or connections we set up: app bugs, one client seeing another's data, a connection we built failing, an automatic job going wrong, a report coming out wrong. **If it starts on our side, we fix it.**

Group B — Out of Our Hands

Things we can't control once the platform is running: an outside service going down, its price or rules changing, wrong data coming back from others, the keys and logins you provide, running costs, and the server you own after handover.

THE MAIN IDEA

We look after problems that come from the software we built, for the agreed support period. We can't be responsible for whether outside services stay online, what they charge, whether their data is right, or how they change their rules, nor for the keys you give us, nor for the day-to-day running costs. **None of these are in our hands once the platform is live.**

02

THE BOUNDARY

Where the Line Sits

AIOS is made of four parts. We build and look after **one** of them, the app itself. The other three, the outside services it connects to, the things you give us, and the server you own, are where the outside factors sit. This is the map for everything else in this document.

Our Software The AIOS app	The app itself: the screens, the automatic jobs, the reports, and the wall that keeps each client's data separate, everything we built and connected together WE LOOK AFTER THIS
Outside Services Other companies' tools	The outside services AIOS plugs into for its data, its AI, and its emails, like Google, the SEO data service, the AI, and the email sender. We connect to them properly; we don't run them. RUN BY OTHERS
What You Give Us Data, keys & access	The keys and logins under your billing, your Google access, your client list, keywords, competitors, and branding. If what comes in is wrong, the results will be too. YOU PROVIDE
Your Server Server, web address & billing	The server, web address, and the balance on every paid service, all in your name from day one . After handover, keeping it running is yours. YOU OWN

WHY IT'S SET UP THIS WAY

By design, you own the platform, the server, and every login the moment we hand over, with no lock-in. That's exactly why the running services, the costs, and the server sit on your side of the line, while **making the software work correctly stays firmly on ours.**

03

GROUP A · WHAT WE LOOK AFTER

What We're Responsible For

Problems that start on our side, in the software we built and handed over. If the real cause is one of these, **we fix it during the agreed support period, at no extra cost.**

OUR JOB

WHAT	WHAT WE LOOK AFTER	IF THE FAULT IS OURS
App bugs	Bugs in the app we built, crashes, screens that don't work, or steps that behave wrongly.	We fix it
Keeping clients separate	The wall that keeps each client's data private. One client must never see another's.	We fix it
Cleaning up the data	Our system that turns data from different sources into one tidy, correct format.	We fix it
Connections we built	The links we built to each outside service, and making them log in, load fully, and retry properly.	We fix it
Automatic jobs	The scheduled jobs running on time and only once, and never sending a report built on old data.	We fix it
Spending safeguards	The limits and the emergency "off switch" we built to stop runaway spending, working as designed.	We fix it
Building reports	Reports building correctly, with your branding, charts showing, and numbers matching the data.	We fix it
Protecting keys	Keeping every key and password locked in the encrypted key vault (Supabase Vault) and out of the logs.	We fix it
Approval step	Nothing going out to a client, email, report, or content, without the human approval step we built.	We fix it
Setup & handover	A working setup at handover: the app installed, a secure web address, and clear handover notes.	We fix it

In short: if it's in the software, settings, or connections we handed over, and it goes wrong because of how we built it, fixing it is on us.

04 GROUP B · OUT OF OUR HANDS

Outside Services & Their Data

AIOS relies on outside services to do its work. We connect to them the right way, but **whether they stay online, what they charge, the rules they set, and whether their data is correct are all out of our hands** once the platform is running.

RUN BY OTHERS

WHAT	WHAT'S OUT OF OUR HANDS	WHO HANDLES IT
Service downtime	An outside service, Google, the SEO data service, the AI, the email sender, going down or slowing.	Them
Price changes	An outside service raising its prices, cutting its free amount, or changing what it charges.	Them
Rule & access changes	An outside service tightening its limits, dropping a feature, or changing its terms.	Them
Wrong data from others	Whether the ranking, backlink, or traffic data an outside service sends back is correct, we show what they give us.	Them
Google results & rules	Google changing how it ranks sites, rankings moving up or down, or a Business Profile being suspended.	Google
Outside service limits	Usage caps, slowdowns, or feature changes inside any hosted service we use.	Them
AI writing quality	Whether AI-written content "reads well" is a matter of taste, a person approves every piece before it's sent.	You approve

WHAT WE'VE ALREADY DONE FOR THIS

When an outside service changes or breaks, we planned for it: safe retries, backup ways to get the data, and a manual option so work carries on. We'll help you adjust, but **the change itself is the other company's, not a fault on our side.**

04 GROUP B · OUT OF OUR HANDS

What You Provide & Running Costs

The rest of Group B: the things you provide and control, the running costs, and everything about the system once it's handed over to you.

YOUR SIDE

WHAT	WHAT'S ON YOUR SIDE	WHO HANDLES IT
Logins & access	A key or Google access that's wrong, expired, or switched off, or a Business Profile that isn't verified.	You
Account balance	A paid account running out of credit or hitting a spending limit under your billing.	You
Running costs	Server rent, web-address renewals, and pay-as-you-go data costs, the ongoing bills, not the one-time build.	You
Costs from your choices	Costs that go up because of your choices, checking more often, adding more clients, using up the free amount.	You
Quality of what you give us	Wrong keywords, locations, competitors, or bad files you upload, the platform works with what it's given.	You
Permissions & privacy	Getting consent to record calls, keeping your privacy policy accurate, and your legal duties for your clients' data.	You
Changes after handover	Edits you or another company make to the software, settings, or server after we've handed it over.	You
Keeping the server healthy	Server updates, backups you choose to keep or turn off, and your web-address settings.	You
New requests	Features beyond what we agreed, handled as a separate, quoted piece of work.	You

To be clear: none of this leaves you on your own, it just says who's in charge of each thing. We'll always advise, and if it needs paid work we'll quote it first. The one-time build and handover is a separate, agreed project from these ongoing items.

05 IN PRACTICE

How a Problem Gets Sorted Out

When something looks wrong, which group it falls into isn't a matter of opinion, **it's decided by what actually caused it**. Here's the exact path every reported problem follows, so there's never any question of who does what.

STEP 1

Something looks wrong

You or the system notices something not working as it should.

STEP 2

You tell us

It's reported to us with what happened, when, and which client.

STEP 3

We look into it

We track down what actually caused it, using our records.

STEP 4

We sort it into a group

The cause decides the group: our software, or an outside factor.

Group A · Our software

We fix it, at no extra cost, during the agreed support period. A bug, a data mix-up, a broken job, a wrong report, **if it comes from what we built, it's on us and we sort it**.

Group B · Outside factor

We tell you exactly what it is, a service outage, an expired key, a usage limit, a running cost, and advise how to fix it. If it needs paid work, we quote it first.

EITHER WAY, YOU'RE NEVER IN THE DARK

Every problem gets a clear answer, backed by our records, on what went wrong and why. How we sort it is open and based on the real cause, **never on what's cheapest for us**.

06 AT A GLANCE

The Whole Thing on One Page

Everything above, on one page. Keep this as your quick reference.

WE LOOK AFTER

- ✓ **App bugs** in the software we built.
- ✓ **Keeping each client's data separate.**
- ✓ **Turning data** into one tidy, correct format.
- ✓ **The connections** we built to other services.
- ✓ **Automatic jobs**, and never sending old reports.
- ✓ **Spending safeguards** working as designed.
- ✓ **Building reports** with your branding.
- ✓ **Keys and passwords** kept in the encrypted vault.
- ✓ **A working setup** and clean handover.

OUT OF OUR HANDS

- × **Outside services** going down.
- × Their **prices, rules, or access** changing.
- × Whether **their data is correct.**
- × **Google's ranking changes** and account rules.
- × **Keys and access you provide** that fail.
- × **Running costs**, server, web address, data.
- × The **quality of what you upload.**
- × **Consent and privacy** for your clients' data.
- × **Changes and new requests** after handover.

THE ONE LINE TO REMEMBER

We look after what we build; you look after what you run. If a problem starts in our software, we fix it during the support period. If it starts with an outside service, something you provide, or day-to-day running, we'll help you sort it, but it's outside what we're responsible for.
