

TEAM & ACCESS

AIOS

Roles & Access Control.

Give every team member exactly the tools their job needs, and nothing they don't. Three ready-made roles, one Super Admin, and a simple on/off switch for every feature.

and do what

01 OVERVIEW

How Access Works

Access in AIOS follows one simple idea: each person only sees the tools their job needs. You start from a ready-made role, which switches on a sensible set of features, and then fine-tune with a single on/off toggle per feature. No code, no complicated settings, just switches.

FEATURES YOU SWITCH
ON OR OFF

0

CODE OR TECHNICAL
SETUP NEEDED

1 • Start from a role

Pick SEO Specialist, Content Creator, or Virtual Assistant. AIOS instantly switches on the standard set of tools that role uses every day, so you're most of the way there in one click.

2 • Fine-tune with toggles

Need to give one person an extra tool, or take one away? Flip its toggle. You can add tasks on top of the template or switch off anything they don't need, per person.

THE MAIN IDEA

Everyone gets the least access that still lets them do their job. The Super Admin (you) always keeps full control, roles make setup fast, and toggles keep it flexible, so a new team member is ready in under a minute with exactly the right tools.

02 THE ROLES

The Three Roles

Each role is a starting template built around one job. Selecting it switches on the tools that job uses, and leaves the rest off. Here's who each role is for and the main tools it unlocks.

SEO Specialist

ANALYTICS & OPTIMIZATION

Runs the technical and analytics side: tracks rankings, audits sites, researches keywords, watches backlinks and competitors, and builds the reports that prove the work.

Rank Tracker

Technical Audit

Keyword Research

Backlinks

Competitors

Content Creator

COPYWRITING & PUBLISHING

Owns the words: writes and edits content with AI help, optimizes titles and meta copy, and pushes finished pieces through the publishing flow to go live.

Content Pipeline

Publishing

On-Page Copy

Keyword View

Virtual Assistant

COORDINATION & ADMIN

Keeps things moving: onboards new clients, sets up websites, manages the task board, and schedules and sends the reports, the day-to-day running of the account.

Onboarding

Task Board

Client Setup

Reporting

Imports

AND ABOVE THEM ALL

The Super Admin (you) has every tool switched on, plus the things no role touches: billing, integrations, the secure key vault of API keys, and managing the team itself. It's the Super Admin who creates each member and decides their access.

SEO Specialist

ANALYTICS & TECHNICAL OPTIMIZATION

Everything needed to measure, diagnose, and improve search performance, with full write access to the analytics and optimization tools, and a read-only view of the content side.

TOOL	WHAT THEY CAN DO	ACCESS
Rank Tracker	Track keyword positions, run on-demand checks, read the ranking history.	Full
Technical Audit	Run site audits, review issues, and mark them fixed.	Full
On-Page Optimizer	Review and apply on-page recommendations for target pages.	Full
Keyword Research	Find, group, and assign keywords to clients and pages.	Full
Backlink Manager	Monitor the backlink profile and flag lost or toxic links.	Full
Competitor Intel	Compare clients against competitors and read the gap analysis.	Full
Local SEO	Track local and map rankings for location-based clients.	Full
Reporting	Build and generate client reports from the live data.	Full
Data Import	Upload and map CSV/Excel exports into the platform.	Full
Content Pipeline	See content status and briefs, but not write or publish.	View
Billing · Integrations · Team	Money, the key vault of API keys, and team management stay with the Super Admin.	Off

Template tip: this is the standard SEO Specialist set. If one specialist also drafts content, the Super Admin can simply switch Content Pipeline from View to Full for that person, no need to change the role.

Content Creator

COPYWRITING & PUBLISHING

Full control of the content workflow, from AI-assisted drafting to going live, with a read-only view of the SEO data that guides what to write, and no access to technical or account settings.

TOOL	WHAT THEY CAN DO	ACCESS
Content Pipeline	Create briefs, draft with AI, edit, and move pieces through review.	Full
Publishing	Send approved content live to the connected site or CMS.	Full
On-Page Optimizer	Write and refine titles, meta descriptions, and page copy.	Full
Task / Workflow Board	Pick up, update, and complete their assigned content tasks.	Full
Keyword Research	See the target keywords and search intent for each piece.	View
Rank Tracker	See how published content is ranking over time.	View
Competitor Intel	Read competitor content angles for inspiration.	View
Reporting	View content-performance reports (read-only).	View
Technical Audit · Backlinks · Local SEO	Technical SEO tools sit outside the content role.	Off
Imports · Billing · Integrations · Team	Data plumbing and account settings stay with others.	Off

Template tip: a common add-on is switching Reporting to Full so a senior writer can assemble content-focused reports themselves, one toggle, no new role needed.

Virtual Assistant

COORDINATION & ADMIN

Runs the day-to-day operations, onboarding, setup, tasks, and getting reports out, with full access to the coordination tools and read-only visibility into the specialist work.

TOOL	WHAT THEY CAN DO	ACCESS
Client Onboarding	Run the onboarding wizard and collect client details and access.	Full
Client & Website Setup	Add and edit clients and their websites in the platform.	Full
Task / Workflow Board	Create, assign, and track tasks across the whole team.	Full
Reporting	Schedule, generate, and send client reports on time.	Full
Data Import	Upload the CSV/Excel files clients and specialists provide.	Full
Rank Tracker	Check rankings to answer client questions (read-only).	View
Content Pipeline	See what content is in progress and when it's due.	View
Local SEO	View local rankings when coordinating local clients.	View
Audit · Keywords · Backlinks	Hands-on specialist tools stay with the SEO Specialist.	Off
Billing · Integrations · Team	Money, the key vault of API keys, and team management stay with the Super Admin.	Off

Template tip: if a trusted VA also enters keywords, the Super Admin can turn on Keyword Research for them, adding one extra task on top of the standard VA set.

06 IN PRACTICE

Creating a Team Member

When the Super Admin adds someone, it's four quick steps. Pick a role to load the template, adjust the toggles if needed, and send the invite. Here's the flow, and what the toggle screen looks like.

1

Add the person

Enter their name and email, the Super Admin sends the invite from here.

2

Pick a role template

Choose SEO Specialist, Content Creator, or Virtual Assistant. The right features switch on automatically.

3

Adjust the toggles

Add an extra tool or switch one off for this person. The template is a starting point, not a cage.

4

Save & invite

Save, and they log in seeing only the tools you switched on, ready to work.

WHY TEMPLATES FIRST, TOGGLES SECOND

Templates mean you're never building access from scratch, one click gets 90% of it right. Toggles mean you're never stuck with the template either. Together they make adding a member fast and safe: sensible defaults, with room to tailor.

07

AT A GLANCE

The Full Access Matrix

Every feature against every role, on one page. This is the default each template sets; the Super Admin can toggle any single cell per person.

FEATURE	SEO SPECIALIST	CONTENT CREATOR	VIRTUAL ASSISTANT	SUPER ADMIN
Rank Tracker				
Technical Audit				
On-Page Optimizer				
Keyword Research				
Backlink Manager				
Competitor Intel				
Content Pipeline

Integrations & Key Vault (API keys)				
Billing				
Team & Access				

Full access, can view and change

View only, can see, not change

No access, hidden for this role

Where the keys live: every API key sits in an encrypted key vault (Supabase Vault) — only the Super Admin can open it. No other role can see or export a key, even when their tools use those keys behind the scenes.
