

What we built today.

A plain-English summary of the day's work on the platform —
what changed, what it means for you, and what's next.

IN ONE GLANCE

A big, productive day.

Today we finished and launched several major upgrades to the platform, mapped out the next wave of features in detail, and put the whole day's work live in production. In plain terms: your Policy Radar became far smarter, your content tool can now plan and build entire sets of pages instead of one at a time, and your citation system took a real step toward the fully automatic "dozens of listings in one click" goal.

6

fresh, useful policy updates
written for you every day

36

citation directories the robot
can now handle, up from 12

10+

new business details we
now collect for listings

1

brand-new bulk-content
research tool

everything checked and
pushed live to production

1

full research & roadmap
document delivered

The rest of this summary walks through each piece in simple language — no jargon — so you can see exactly what we did and why it matters. It also honestly flags what is **not** done yet and is coming next.

POLICY RADAR

A real daily briefing.

Policy Radar is the part of the platform that keeps you on top of Google's constant rule changes. Until today it worked by quietly watching a handful of Google's web pages and flagging whenever something on them changed. The problem was that those alerts were vague and not very useful — you'd get a note that essentially said "something changed on this page," with no real insight into what it meant or what to do about it.

We rebuilt it from the ground up. Now, **every day the system uses AI to research the most important, current developments in Google Search and SEO**, and writes them up as six clear, genuinely useful updates you can actually act on — real core updates, guideline shifts, and ranking changes, each with a recommended action.

On top of that, whenever you want to dig deeper into any specific policy or topic, you can simply ask, and the system researches it live and comes back with a detailed, up-to-date answer. In short, Policy Radar went from a noisy change-detector into a proper daily briefing — the kind of thing an expert would hand you each morning.

WHAT THIS MEANS FOR YOU

Instead of vague alerts, you and the team open the dashboard to six meaningful, act-on-them-today policy updates every day — and can ask for an in-depth take on anything, on demand.

CONTENT

From one page to your whole site.

Earlier in the day we made two important fixes to the content tool. First, we removed a quality-check step that had been making every single page take around half an hour and a lot of cost to produce. The system now writes top-quality content up front, and your team simply reads and approves it — much faster, without losing quality. Second, we proved the whole thing works end to end by generating a full article and publishing it straight into a live WordPress website as a draft, ready for a final human check.

Then we built something bigger: a **Research module**. Instead of asking for one page at a time, you can now point the system at a website, tell it what kind of pages you want — services, locations, service-and-location combinations, blogs, FAQs and so on — and it studies that site and its competitors and comes back with a recommended list of pages, shown as a simple set of checkboxes.

You tick the pages you want, or select them all at once, and the system takes over from there: it researches, plans the keywords, writes the content, and publishes each page — then hands you back the links. This is the foundation of the "plan and build my whole website with a few clicks" vision you described, and it's now live and ready to use.

STILL TO COME FOR CONTENT

Making the published pages fully editable inside WordPress's page builder (Elementor), and matching the existing site's design, are the next step — planned, not yet built.

CITATIONS & THE AUDIT

Toward listings on autopilot.

Citations are the business listings — think Yelp and local directories — that help a business show up in local search. The long-term goal is a browser robot that creates these listings automatically across dozens of directories with a single click. Today we moved that forward on three clear fronts.

First, we expanded the information we collect about each business. The system used to hold just the basics — name, address and phone. Now it also captures a description, email, logo, social media links, opening hours, payment types and more, because real directories ask for all of this to build a complete listing.

Second, we more than doubled the robot's reach. It now knows how to fill out the sign-up forms for 36 directories, up from 12, spanning the US, UK, Canada, Australia and global sites — well on the way to the 40–50 target you set.

Third, we built the smart audit. Rather than dumping every directory on a client, the system now works out the client's country and industry and recommends listings in a sensible order: the must-have general directories first, then country-specific ones, then industry-specific ones. So an Australian plumber sees Australian and plumbing directories — not irrelevant US ones. This audit is done and live.

WHAT'S DONE, AND WHAT'S NEXT

Straight about where we are.

You asked about three things — content, the citation audit, and indexing. Here is the honest picture. The **citation audit is done** (prioritised generic → country → niche, and live). The **content research tool is done** — planning and building whole sets of pages — though making those pages editable in the page builder is still to come. **Indexing is not built yet**: we researched and planned it fully, but the actual tool that tells Google about new pages hasn't been built. It's next in the queue.

We also produced a full research-and-plan document (a separate PDF you have). Its most reassuring finding: **a great deal of the hard machinery already exists** — the citation robot, the large directory list, the content pipeline and the WordPress connection are all built. That let us pin down exactly what remains: the robot creating its own account on each directory (which needs an email-confirmation step), more directory recipes, page-builder editing, and the brand-new indexing tool.

COMING NEXT — THE BIG ONE

The main focus now is the **web automation for citations and Web 2.0** — the browser robot that creates accounts and posts listings across every platform, tested and built out properly. That's the next phase of work.

CHECKED & LIVE

Checked, shipped, and live for you.

Before anything went live, we ran extensive automated checks to make sure the new work didn't break anything that was already working. Once it passed, we pushed the entire day's work to production, so the finished pieces are live for you now.

To recap what's live today: Policy Radar's daily AI briefing, the new bulk-content Research module, and the expanded citation system with its smart audit. Each was built to be driven directly and reliably, with the dashboard screens layering on top of the same engine.

And what's next is clear and already planned: the citation and Web 2.0 web automation — creating accounts and posting listings across every platform automatically — followed by page-builder editing for content and the new indexing tool. We build and test each of these next.

THE BOTTOM LINE

A productive day — real features shipped and live, an honest and clear roadmap for the rest, and a solid step taken toward the fully automatic vision for content and citations.
